

Qdabra™ Database Accelerator

Reshredding all documents for a document type using Document Deployer

The Qdabra DBXL Administration Tool (DAT) allows you to quickly reshred all documents from a document type:

1. Open the configuration for the document type by clicking the **Edit** icon
2. Select the **Documents** tab and click on the **Reshred All** button.

However, you may encounter an error due to timeout if your document type contains too many documents (usually in the order of thousands).

The good news is that you can use Document Deployer to reshred a large number of documents. The tool reshreds the documents one by one so that the timeout does not occur. Here is how you do it:

1. Copy the attached Scenario File (ReshredDocument.xml) to Document Deployer's Scenario folder, which in default installation is located at C:\Program Files\Qdabra Software\Qdabra DBXL Migration Tool\Scenarios.
2. Open the **DBXL Migration Tool UI** from Start > Programs > Qdabra > Tools > DBXL Migration Tool.
3. Make sure DBXL Server Root is set to your DBXL, usually <http://<servername>/QdabraWebService>.
4. Select the **Custom** tab and load the scenario you've copied in step 1.
5. Scroll down in the scenario variables list and set **docType** to the document type you want to reshred.
6. Scroll down the **Scenario Variables** list and make sure that the sourceDBXL and targetDBXL both have the same value entered in step 3.
7. Select **ReshredDocuments** in the scenario runs and click **Run**. This will reshred all the documents in the specified document type.
